

Self-Reflection

Working on the Legacy Lawn Care website taught me a lot about web development. I want to be honest that I used AI a lot during this project. I'm still learning how to structure pages, remember HTML/CSS rules, and stay organized, so having help made it easier for me to understand what I was doing.

I kept the same navbar and footer on every page to make the site feel consistent. I moved the testimonials to the Home page so visitors see them right away, and I added a picture carousel on the About page to make it more visual. The Services page lists everything clearly, and the Contact page includes a form. Bootstrap helped me with spacing and making the layout responsive.

I added some JavaScript to check the contact form, and the CSS adds simple effects to make the site look nicer. I did notice that when I forgot the proper way to handle spacing, I used `<br>` tags as a shortcut. That's something I want to improve so my code looks cleaner and more professional.

There are still things I need to fix. The form doesn't actually send data yet, and I need to work on accessibility, like adding labels and making sure the text is easy to read. I also want to get better at remembering best practices so I don't have to rely on AI as much for basic tasks.

Overall, I'm proud of how the site turned out. It looks clean, works on different devices, and represents the business well. This project showed me that I can build a full website, even if I need help along the way. I'm learning and getting more confident with each project.
