

Self-Reflection

Making the Legacy Lawn Care website was a good learning experience for me. I wanted the site to look professional, be easy to use, and work well on phones and computers. I think I did a solid job overall.

I kept the pages consistent, with the same navigation bar and footer so everything feels connected. The Home page has a clear call to action, the About page tells the story and shows testimonials, the Services page lists what's offered with pictures, and the Contact page has a form people can fill out. Using Bootstrap helped me make the layout responsive without too much extra work.

I also added some JavaScript so the contact form checks for empty fields and gives feedback. That makes the site feel more interactive. The CSS adds polish with hover effects, background images, and responsive text sizes.

There are still things I could improve. I used `<div>` tags for spacing in some places, which isn't the best practice. The forms don't actually send data anywhere yet, so they're more like demos. I also need to pay more attention to accessibility, like adding labels and making sure text is easy to read for everyone.

Overall, I think I did well. The site looks clean, works across devices, and shows off the business in a professional way. At the same time, I know what I need to work on next — connecting the forms, improving accessibility, and cleaning up spacing. This project gave me confidence that I can build a complete website from scratch and keep improving as I go.
